

Update:

What's new in V.8

PLANNING STATION

What's new in Voyager PLANNING STATION V.8

We are excited to bring you our next version of Voyager PLANNING STATION.

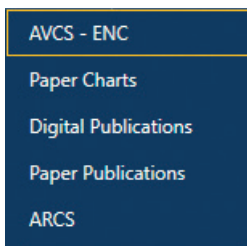

We've listened to your feedback so this new version is **faster and better**.

Take a look below at the new improvements:

- You no longer have to wait for a task to complete. You can run a web download or import an AVCS DVD and continue working with Voyager at the same time.
- All sub-menus now open automatically, so that you don't miss any features or options.
- New colours in the software, representing our values and giving a better contrast to make it easier for you to read.

You are getting more digital, so are we:

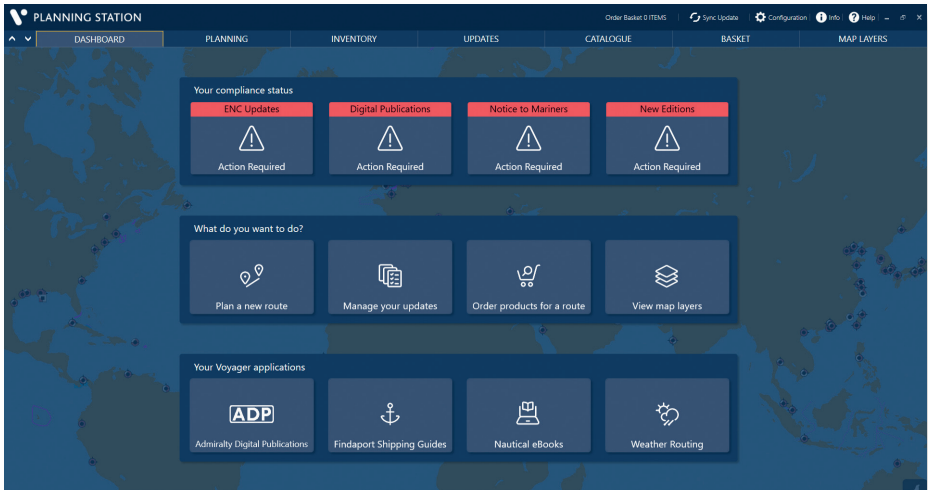

- You've told us that AVCS is the most used product, so we've put it at the top of the list.
- And we've put Digital Publications before the Paper Publications versions.

Improved, clearer and more organised Dashboard - your shortcut into Voyager PLANNING STATION

- Quick access to your holdings and updates, showing you what you need to do.
- Quick access to the most important tasks.
- Quick access to third party applications that you have installed.

Route Planning - As easy as it can be (with the option of additional, paid features)

- An optional inbuilt port to port route planning tool enables routes to be automatically generated between two points which can then be refined to meet specific orders and other voyage requirements.
- A Route Validation tool gives you the option to run digital safety checks between each waypoint and compare navigational data with the vessel's draught, height and other specifications. Validating routes before transferring to ECDIS reduces the risk of the ECDIS route validation failing and streamlines the route and passage planning process prior to the start of a voyage.

AVCS Updating - Safer than ever:

- V-Drive now securely exports your Voyager PLANNING STATION route file as well as AVCS ENCs, updates and permits making the process of transferring information to ECDIS faster and more efficient.
- New Status: 'Updates to export' and 'Updates to apply', makes it easier to identify safety and compliance related actions.
- More control for the user to see which updates have already been installed on your ECDIS and which are still outstanding.
